

Fisher Cubes

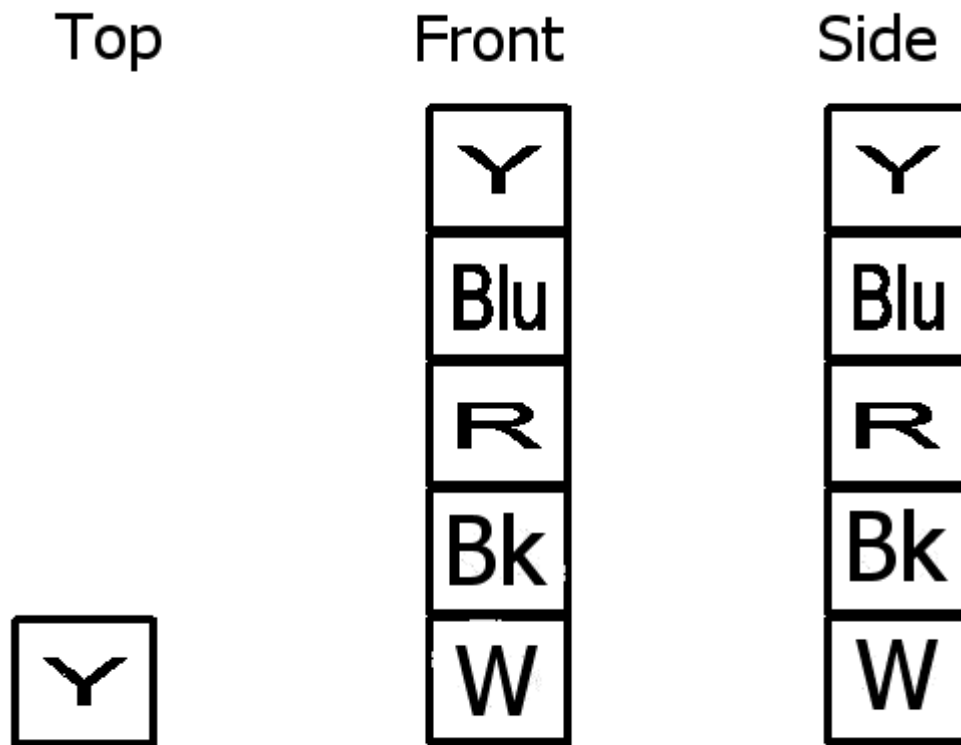

This activity helps you see how things would look from different directions. You will need some small square Lego blocks in several colours, blue, black, white, red, grey and yellow for this activity.

Step 1. Build the pattern from the plan

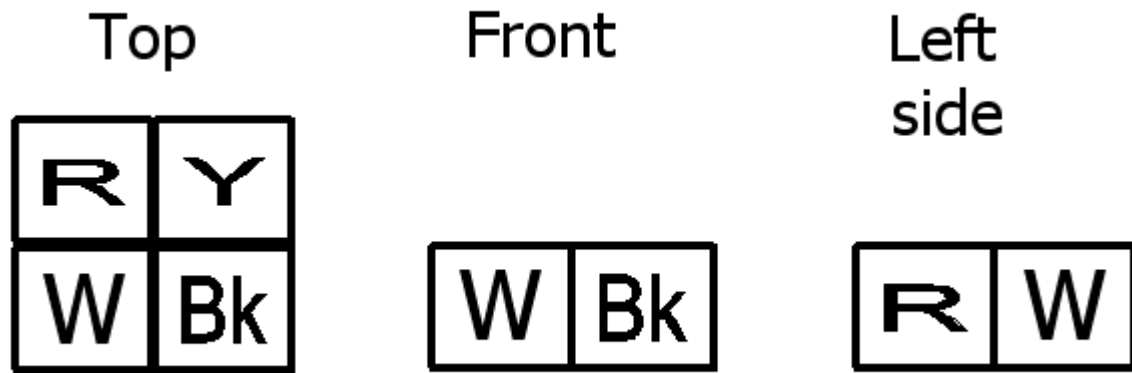

Sit at a table or desk with your Lego blocks. You are now going to build a pattern of blocks based on a plan which shows you the pattern from different directions, much like an architect draws a house and the builder constructs it from the plan. You will see the pattern from the front, the side and the top and from all these views you can construct your model.

Each plan becomes more and more complicated and you will have to see the model from different directions to make it.

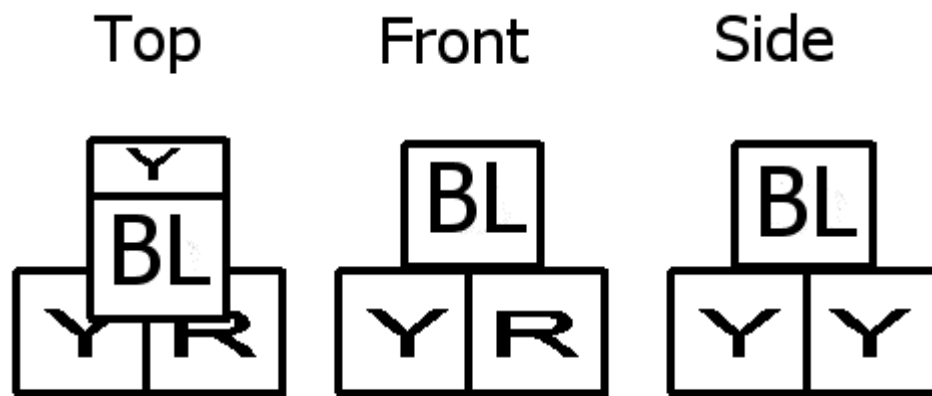

Begin with level 1 and progress through all the levels.
